Re: Confirmation of references

To: Whom it may concern

The Enfoglobe Inc. provided to the Slovak Road Administration (SRA) a monitoring and management system APPIA which is focused on investment construction i.e. all projects based on the bill of quantities. The pilot project was the project "I / 68 - Prešov, Škultétyho street - ZVL, road relocation." System testing took place in the years 2012 - 2015, while the Enfoglobe provided to the SRA system APPIA, including free consultations and output adjustment, free of charge (integral part of the pilot project was the provision of user documentation and users training).

The pilot infrastructure project was a state first-class road in the urban area of 2 km length, with a large number of objects (90) including 6 bridges, adaptation of the railway line, construction of noise walls and relocations of utilities - total project costs were over 30 million EUR.

The system APPIA, despite the great complexity of this project, proved to be a very effective tool for monitoring and project management at all hierarchical levels - from operational management directly on the site to the level of the overall investment management process within the SRA, while greatly helped the fact that Enfoglobe not only prepared Slovak version of APPIA, but also implemented into output adjustment, the experience gained from all applications of the system. Extremely valuable help for managers was indication of deviation from the approved schedule. The Enfoglobe implemented very operatively into the system the multi-source financing which is typical for the projects supported by the European Union.

The APPIA and services Enfoglobe Inc. fully met our expectations and therefore we can recommend the system APPIA to all potential users in the field of the investment construction.

Yours sincerely,
